Senior Software Engineer - Software Security

About Vimaan

Vimaan Robotics is a privately held technology company, founded in 2017 and headquartered in Silicon Valley. Vimaan is driving a paradigm shift in the way computer vision is enabled and leveraged for inventory management in the supply chain and logistics industry. Vimaan's proprietary SaaS-based end-to-end solution provides comprehensive and real-time tracking of inventory movement and status within the warehouse; seamlessly integrates into existing legacy workflows and ecosystems; enables full autonomy and scalability; generates rich, actionable data for supply chain operators; and delivers dramatic monetary returns through cost savings and customer satisfaction improvement.

Vimaan was one of the recipients of the Amazon $1B Warehouse Innovation Fund last year. The company has over 90 employees in various locations in the US and one location in Bengaluru, India.

Key Responsibilities

- Collaborate extensively with engineers, customers, and senior management to build and ship key features.
- Help architect and build internal libraries, standards, and frameworks to drive engineering-wide consistency.
- Develop modular and consistent architectures across products, including documentation of approach and test cases.
- Design and implement software solutions that leverage SQL and NoSQL databases and customizable no-code/low-code workflow applications.
- Develop and maintain technical documentation, including architecture diagrams, design documents, and system documentation.
- Collaborate with cross-functional teams to identify technical requirements and deliver solutions that meet them.
- Provide technical guidance and mentorship to peers.
- Conduct code reviews to ensure adherence to coding standards and best practices.

- Continuously evaluate new technologies and tools to ensure the organization is using the most effective solutions.
- Ensure scalability, reliability, **security**, and performance of software solutions.
- Analyze, troubleshoot, and proactively identify potential issues.

Requirements

Must Have

- BS or MS degree in Computer Science or equivalent with **2–3 years of software development experience**.
- Strong emphasis on **software security**, with practical knowledge of secure coding practices, authentication, authorization, and data protection.
- Understanding of **CI/CD pipelines** and deployment practices.
- Familiarity with **Nginx** for load balancing, reverse proxy, and web serving.
- Experience designing and developing software solutions with SQL and NoSQL databases.
- First-hand experience with **Neo4J database**.
- Good handle on **HA and ELK stack**.
- Solid understanding of software architecture and design patterns.
- Strong foundation in Object-Oriented Design, Architectural patterns, Data Structures, Algorithms, Operating Systems, and Software Engineering.
- Full-stack development experience with **Java**.
- Experience with **microservices and REST API-based architectures**.
- Experience designing multi-threaded applications.
- Familiarity with system traffic/load handling and performance optimization.
- Knowledge of security concepts at the services and system levels.
- Familiarity with Agile development methodologies.
- Willingness to work across the stack and learn new technologies quickly.

Good to Have

- Experience with caching tools like **Redis** and Apache components.
- Experience with no-code/low-code workflow application development.
- Familiarity with **Angular Web Framework** and services.
- Cloud expertise and experience with storage tools.
